Senior full stack engineer, 8+ years, expert level TypeScript across Node.js services and modern front ends. Builds AI systems that run in production, not demonstrations: a LangGraph agent whose state machine scores on a schedule and writes back its reasoning, and a multitenant retrieval layer on pgvector with Redis and BullMQ for durable, idempotent ingestion. Works inside agentic coding loops with Claude Code every day, under a rule that nothing merges until two frontier models have reviewed it independently. Works autonomously by default sole engineer on Luxura: eleven weeks from empty repository to Google Play, 5,000+ downloads, backend, authentication and self hosted infrastructure included. Based in Bogotá, working US Eastern hours.

Core Competencies

- **TypeScript & Node.js:** expert level TypeScript: generics, discriminated unions, exhaustive type narrowing across API boundaries; Node.js and Express services, Next.js route handlers, Bun; also Python, PHP/Laravel.
- **AI, Agents & Retrieval:** LangGraph state machine agents, RAG pipelines, pgvector and vector databases, embeddings and chunking, retrieval tuning, guardrails and confidence thresholds on model output, voice agents, MCP, agentic development with Cursor and Claude Code, multimodal adversarial review.
- **Frontend:** React, Next.js, SvelteKit, Vue, Capacitor, React Native, Expo; component design, state management, accessibility.
- **APIs, Integrations & Security:** REST and webhook design, OAuth and token based flows, session and refresh handling, single sign on through Entra ID and ADFS, Slack API, Microsoft Graph, rate limiting, secret management.
- **Data & Pipelines:** PostgreSQL and Prisma, Redis, BullMQ, Socket.IO, idempotent ingestion with retries and replay, PDF and email parsing at multisource scale, transformation workflows.
- **Cloud & Infrastructure:** AWS and Azure, serverless and edge runtimes (Vercel, Azure Functions, AWS Lambda), Docker, Linux, Hetzner, Coolify, CI/CD.
- **Analytics & Growth:** PostHog, AppsFlyer attribution, Firebase Analytics, RevenueCat, Google Play release and monetization, Meta/Google/TikTok Ads with his own attribution modeling.

Professional Experience

- **Level60 Consulting** **Remote, Bogotá, Colombia**
Principal Full Stack Engineer *2021 to 2026*
 - Principal engineer on the platform for five years. Joined it two years in and became the constant across it, owning the integration and alerting layers: multitenant Exchange calendar sync, Teams Panel discovery and tracking, peripheral fault detection, and global alerting with daily caps and summary digests.
 - Principal author of the separate Python and Flask service on Azure that integrates the platform with the client ERP.
 - Worked daily in a Laravel 10 and PHP 8.1 codebase, building and maintaining two administrative surfaces over the same domain in Filament and Laravel Nova, so operations staff and engineers each had the tool that suited them.
 - Designed the asynchronous layer: queued jobs and scheduled console commands under Horizon, with Redis backing, for ingestion and reporting work that could not run inline.
 - Secured the API with Laravel Passport OAuth2 and two factor authentication, and published it through OpenAPI documentation so downstream teams could integrate without asking.
 - Wrote unit and feature tests in PHPUnit with Mockery, and ran Rector for automated refactoring across a long lived codebase.
 - Integrated the PHP application with the Microsoft estate: Microsoft Graph and Teams ingestion, Azure Blob Storage, Azure SQL and Logic Apps, with single sign on through Entra ID and ADFS.
- **Own Products: Luxura** **Bogotá, Colombia**
Independent Engineer *2021 to Present*

- **Luxura** (live, Google Play): invitation based dating app for Bogotá and Medellín. Eleven weeks from empty repository to store; 5,000+ downloads. Next.js, TypeScript, Capacitor, PostgreSQL, Prisma, Socket.IO, RevenueCat, AppsFlyer, AWS Rekognition.
- **monia** (live demo): personal finance ledger built from bank email. Transaction alerts and statement PDFs parsed into ledger rows across five institutions and five currencies, with idempotent ingestion. A double counted row is a wrong balance. TypeScript and the Gmail API.
- **Storía** (in development): multitenant AI customer service for LatAm small business. Retrieval augmented answers over per tenant corpora: pgvector, Redis, BullMQ, WhatsApp Cloud API, voice agents.
- **Mate** (built, not launched): LangGraph agent whose state machine scores compatibility against a vector database on a schedule, then writes the user the reason. Traced a production incident to fixtures covering 75% of a path.
- Self hosted production on Hetzner with Docker and Coolify; ran paid acquisition on Meta, TikTok and Google with attribution modeling. Built the app, ran the server, bought the ads.

▪ **Gara Group Inc.**

Remote, Cúcuta, Colombia

Full Stack Developer

2020 to 2021

- Built direct sales and network marketing platforms in Laravel with Vue front ends, covering both the distributor back office and the customer facing sites.
- Modelled commission and downline structures in Eloquent, and handled the recurring calculation work through queued jobs rather than request time.

▪ **Pukara**

Remote

Freelance Full Stack Developer

2018 to 2020

- Built hospital management software for a Spanish client.
- Consulted across several client projects.

Education

▪ **freeCodeCamp**

Full Stack Certification

2016 to 2017

Front end and back end web development, JavaScript, APIs.

▪ **UNET, Universidad Nacional Experimental del Táchira**

Venezuela

Ingeniería Informática (two years completed)

2014 to 2016

Computer science fundamentals.

Languages

- Spanish (native), English (C1, works US Eastern hours in English daily).
