Senior application engineer, 8+ years full stack, building the services and interfaces that put AI and data insights in front of users. Authors Python backends, including the ERP integration service that runs in production, alongside React and Next.js front ends, on PostgreSQL, MySQL and Azure SQL. Runs containerised workloads on Docker across AWS and Azure, with serverless and event driven services, CI/CD and branch protection policy he wrote himself. Builds retrieval and agent systems on pgvector and LangGraph, so the application layer and the AI layer are the same job. Based in Bogotá, working US Eastern hours.

Core Competencies

- **Python & Backend Services:** Python REST services in production, FastAPI and Flask, RESTful API design, microservices, event driven and async processing, twelve factor configuration and secret management.
- **Frontend:** React, Next.js, Vue, SvelteKit, TypeScript generics and discriminated unions across API boundaries; component design, state management, accessibility.
- **Databases & Data:** PostgreSQL, MySQL, Azure SQL, Analysis Services, Prisma and schema migrations, Redis, BullMQ, idempotent ingestion with retries and replay.
- **Containers, Cloud & CI/CD:** Docker, Linux, serverless and edge runtimes (Azure Functions, AWS Lambda, Vercel), cross cloud across AWS and Azure, Hetzner and Coolify, CI/CD pipelines, branch protection policy.
- **AI & Machine Learning Delivery:** LangGraph agents, RAG, pgvector and vector databases, embeddings and chunking, AWS Rekognition, agentic development with Claude Code, multimodal adversarial review.
- **Enterprise Integration & Security:** Microsoft Graph API, Teams API, Entra ID, ADFS, single sign on, OAuth and token flows, Slack API, ServiceNow, Logic Apps.
- **Quality & Practice:** automated testing and test quality review, debugging and system design, Agile ceremonies, code review as a gate rather than a formality.

Professional Experience

- **Level60 Consulting** **Remote, Bogotá, Colombia**
Principal Full Stack Engineer *2021 to 2026*
 - Principal engineer on the platform for five years. Joined it two years in and became the constant across it, owning the integration and alerting layers: multitenant Exchange calendar sync, Teams Panel discovery and tracking, peripheral fault detection, and global alerting with daily caps and summary digests.
 - Principal author of the separate Python and Flask service on Azure that integrates the platform with the client ERP.
 - Wrote unit and feature tests in PHPUnit with Mockery, and established a branch protection policy requiring peer code review before merge.
 - Principal engineer on a room health platform monitoring Microsoft Teams Rooms, Cisco and Zoom hardware, including multitenant Exchange calendar sync and Teams Panel discovery.
 - Replaced a Logic Apps pipeline with direct Microsoft Graph ingestion for ServiceNow incident creation.
 - Administered the Azure platform: Entra, Blob Storage, Logic Apps, Azure SQL and Analysis Services; diagnosed and resolved Azure SQL quota failures on archive tables.
 - Implemented single sign on through Entra ID and ADFS, and assessed the platform impact of Microsoft's TeamworkDevice API retirement.
 - Traced a six month reporting gap to an expired storage credential and a row terminator mismatch.
 - Established branch protection policy requiring PR review before merge.
- **Own Products: Luxura** **Bogotá, Colombia**
Independent Engineer *2021 to Present*

- **Luxura** (live, Google Play): invitation based dating app for Bogotá and Medellín. Eleven weeks from empty repository to store; 5,000+ downloads. Next.js, TypeScript, Capacitor, PostgreSQL, Prisma, Socket.IO, RevenueCat, AppsFlyer, AWS Rekognition.
- **monia** (live demo): personal finance ledger built from bank email. Transaction alerts and statement PDFs parsed into ledger rows across five institutions and five currencies, with idempotent ingestion. A double counted row is a wrong balance. TypeScript and the Gmail API.
- **Storía** (in development): multitenant AI customer service for LatAm small business. Retrieval augmented answers over per tenant corpora: pgvector, Redis, BullMQ, WhatsApp Cloud API, voice agents.
- **Mate** (built, not launched): LangGraph agent whose state machine scores compatibility against a vector database on a schedule, then writes the user the reason. Traced a production incident to fixtures covering 75% of a path.
- Self hosted production on Hetzner with Docker and Coolify; ran paid acquisition on Meta, TikTok and Google with attribution modeling. Built the app, ran the server, bought the ads.

▪ **Gara Group Inc.**

Remote, Cúcuta, Colombia

Full Stack Developer

2020 to 2021

- Built web applications for direct sales and network marketing platforms using Laravel and Vue.
- Developed both the distributor back office and the customer facing sites.

▪ **Pukara**

Remote

Freelance Full Stack Developer

2018 to 2020

- Built hospital management software for a Spanish client.
- Consulted across several client projects.

Education

▪ **freeCodeCamp**

Full Stack Certification

2016 to 2017

Front end and back end web development, JavaScript, APIs.

▪ **UNET, Universidad Nacional Experimental del Táchira**

Venezuela

Ingeniería Informática (two years completed)

2014 to 2016

Computer science fundamentals.

Languages

- Spanish (native), English (C1, works US Eastern hours in English daily).
